The teaching staff is a team!

Professor Roberts	M	1600-1800 (SSB 299)
Jason Bigenho	Th	1000-1200 (Econ 116)
Shane Xuan	M	1100-1150 (SSB 332)
	Th	1200-1250 (SSB 332)

Supplemental Materials

UCLA STATA starter kit

<http://www.ats.ucla.edu/stat/stata/sk/>

Princeton data analysis

<http://dss.princeton.edu/training/>

Some quick notes before we start today's section:

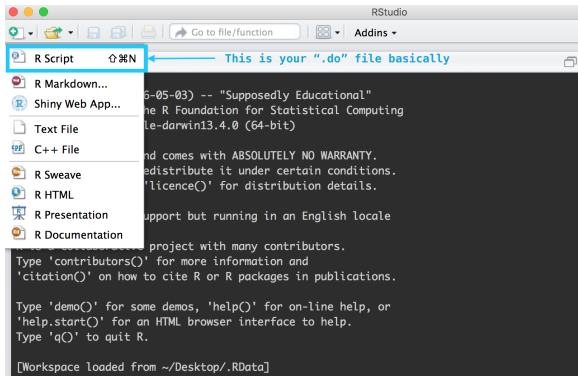

- ▶ Make sure that you pass around the attendance sheet

Some quick notes before we start today's section:

- ▶ Make sure that you pass around the attendance sheet
- ▶ Open the R console (**RStudio** recommended); I will be using my slides, but you should work in your console

Some quick notes before we start today's section:

- ▶ Make sure that you pass around the attendance sheet
- ▶ Open the R console (**RStudio** recommended); I will be using my slides, but you should work in your console

- ▶ Changing working directory (`setwd`):

- ▶ Changing working directory (`setwd`):
`setwd("/Users/Shane/Dropbox/Poli5D/dataforlecture")`

- ▶ Changing working directory (`setwd`):
`setwd("/Users/Shane/Dropbox/Poli5D/dataforlecture")`
- Your working directory depends on where you saved your folder

- ▶ Changing working directory (`setwd`):
`setwd("/Users/Shane/Dropbox/Poli5D/dataforlecture")`
- Your working directory depends on where you saved your folder
- ▶ Read in data (`read.csv`):

Set up

- ▶ Changing working directory (`setwd`):
`setwd("/Users/Shane/Dropbox/Poli5D/dataforlecture")`
- Your working directory depends on where you saved your folder
- ▶ Read in data (`read.csv`):
`data ← read.csv ("moms_clean.csv")`

Set up

- ▶ Changing working directory (`setwd`):
`setwd("/Users/Shane/Dropbox/Poli5D/dataforlecture")`
 - Your working directory depends on where you saved your folder
- ▶ Read in data (`read.csv`):
`data ← read.csv ("moms_clean.csv")`
 - Note that `←` is an assignment operator in R
 - What you did with this command is to load the data, and throw them in an object called `"data"`

- ▶ `names()` gives you the names of an object

Basic functions

- ▶ `names()` gives you the names of an object
- ▶ `head()` or `tail()` returns the first or last parts of a vector

Basic functions

- ▶ `names()` gives you the names of an object
- ▶ `head()` or `tail()` returns the first or last parts of a vector
- ▶ `summary()` is similar to the `summarize` function in Stata

Basic functions

- ▶ `names()` gives you the names of an object
- ▶ `head()` or `tail()` returns the first or last parts of a vector
- ▶ `summary()` is similar to the `summarize` function in Stata
- ▶ `nrow()` and `ncol()` return the number of rows and columns of the data

- ▶ In R, we use
 - Parentheses for function
 - Brackets for indices
 - Dollar signs for variables

- ▶ In R, we use
 - Parentheses for function
 - Brackets for indices
 - Dollar signs for variables
- ▶ A data frame is similar to a matrix; you can use `is.data.frame()` to check if the data set is a data frame

Data frame (2)

- ▶ Create a data frame:

```
d ← data.frame(integers=1:3, names=c("a","b","c"))
```

Data frame (2)

- ▶ Create a data frame:

```
d ← data.frame(integers=1:3, names=c("a","b","c"))
```

```
> d
  integers names
1         1    a
2         2    b
3         3    c
```

Data frame (2)

- ▶ Create a data frame:

```
d ← data.frame(integers=1:3, names=c("a","b","c"))
```

```
> d
  integers names
1         1     a
2         2     b
3         3     c
```

- ▶ Row and column in a matrix: `d[row, column]`

Data frame (2)

- ▶ Create a data frame:

```
d ← data.frame(integers=1:3, names=c("a","b","c"))
```

```
> d
  integers names
1         1     a
2         2     b
3         3     c
```

- ▶ Row and column in a matrix: `d[row, column]`

`d[,1]` is the first **column**

Data frame (2)

- ▶ Create a data frame:

```
d ← data.frame(integers=1:3, names=c("a", "b", "c"))
```

```
> d
  integers names
1         1    a
2         2    b
3         3    c
```

- ▶ Row and column in a matrix: `d[row, column]`

`d[,1]` is the first **column**

`d[1,]` is the first **row**

Data frame (2)

- ▶ Create a data frame:

```
d ← data.frame(integers=1:3, names=c("a", "b", "c"))
```

```
> d
  integers names
1         1     a
2         2     b
3         3     c
```

- ▶ Row and column in a matrix: `d[row, column]`

`d[,1]` is the first **column**

`d[1,]` is the first **row**

```
> d[,1]
[1] 1 2 3
> d[1,]
  integers names
1         1     a
```

Data frame (3)

- ▶ Specify a variable in the data frame: use `$`

Data frame (3)

- ▶ Specify a variable in the data frame: use `$`
- ▶ For example, if a data frame called `poli5` contained a variable called `pset`, you can access the variable `pset` using `poli5$pset`

- ▶ `mean()`; `median()`

Other functions

- ▶ `mean()`; `median()`
- ▶ Use `seq()` to create a sequence :

Other functions

- ▶ `mean()`; `median()`
- ▶ Use `seq()` to create a sequence :
`seq(from, to, by)`

Other functions

- ▶ `mean()`; `median()`
- ▶ Use `seq()` to create a sequence :
`seq(from, to, by)`
- ▶ What is the output of `seq(2,10,4)`?

Other functions

- ▶ `mean()`; `median()`
- ▶ Use `seq()` to create a sequence :
`seq(from, to, by)`
- ▶ What is the output of `seq(2,10,4)`?

```
> seq(2,10,4)
[1] 2 6 10
```

Other functions

- ▶ `mean()`; `median()`
- ▶ Use `seq()` to create a sequence :
`seq(from, to, by)`
- ▶ What is the output of `seq(2,10,4)`?

```
> seq(2,10,4)
[1] 2 6 10
```

- ▶ `table()`
